Project Abstract

Virtual Reality (VR) is the easiest and simplest way to offer best practices to anxiety patients. VR allows the patient to interact with environments in between in vivo and imaginal exposure, improving the flow and outcomes of exposure therapy.

Psious is a mobile based technology which uses hyper-realistic virtual environments to treat anxiety disorders by virtual gradual exposure. Its mission is to revolutionize the mental health care arena democratizing and socializing the virtual exposure treatments. The Psious platform offers the benefits of VR quickly and easily, through your own smartphone and 3D goggles, with no need for costly or complex equipment investments. Designed by psychologists, Psious was built as a complementary toolsuite to help you better manage the difficulties presented by exposure therapy.

Interactive, immersive environments allow the patient to be the protagonist of their therapy, helping to reduce psychological barriers to treatment, increasing their trust in the Therapeutic Alliance and maintaining their confidentiality. Psious offers treatments adaptable to each patient, allowing the therapist to have total control over exposure parameters and a greater knowledge of what the patient is experiencing.

Psious provides a subscription model offering three packages (basic, professional, and platinum) with different features.
