### 2.2 Project Abstract

momit Care is a smart device that connects our heating boiler to the Internet, enabling manufacturers and repair and maintenance firms to control them remotely based to an open protocol between the boiler and momit Care. They can read information about the status, operating mode, errors, etc. and may also remotely manage many functions of the boiler, enabling a new range of services around it. momit Care changes the way the servicing is provided, and can even be proactive, knowing even before the final customer if there is a problem, having the chance to solve it remotely.

If a repair is necessary, the technician will know before his visit, and do this with a previously closed quote, offering a better and cheaper service. The savings will be very significant for the service provider; they may also be able to collect a huge amount of data around boilers which will allow to predict issues, improve maintenance service or improve production processes.

momit has developed two smart thermostats, momit Smart Thermostat and momit Home Thermostat, that not only reduces power consumption and helps to protect the environment, but also saves up to 30% on your home energy bill.

### 2.3 Sector

Manufacturing

### 2.4 Target Market

B2B

### 2.5 Business Model

N/A

momit Care FIWARE Short Profile
